## 01. Why we Need Complex Numbers ?

The equations of the form  $x^2 + 1 = 0$ ,  $x^2 + 4 = 0$  etc. are not solvable in  $R$  i.e. there is no real number whose square is a negative real number. Euler was the first mathematician to introduce the symbol  $i$  (iota) for the square root of  $-1$  i.e. a solution of  $x^2 + 1 = 0$  with the property  $i^2 = -1$ . He also called this symbol as the imaginary unit.

## 02. Integral Powers of Iota ( $i$ )

Positive integral power of  $i$ : We have,

$$i = \sqrt{-1}$$

$$\therefore i^2 = -1$$

$$i^3 = i^2 \times i = -i$$

$$i^4 = (i^2)^2 = (-1)^2 = 1$$

In order to compute  $i^n$  for  $n > 4$ , we divide  $n$  by 4 and obtain the remainder  $r$ . Let  $m$  be the quotient when  $n$  is divided by 4. Then,

$$n = 4m + r, \text{ where } 0 \leq r < 4$$

$$\Rightarrow i^n = i^{4m+r} = (i^4)^m i^r = i^r$$

Thus, the value of  $i^n$  for  $n > 4$  is  $i^r$ , where  $r$  is the remainder when  $n$  is divided by 4.

Negative integral powers of  $i$ :

By the law of indices, we have,

$$i^{-1} = \frac{1}{i} = \frac{i^3}{i^4} = i^3 = -i$$

$$i^{-2} = \frac{1}{i^2} = \frac{1}{-1} = -1$$

$$i^{-3} = \frac{1}{i^3} = \frac{i}{i^4} = i$$

$$i^{-4} = \frac{1}{i^4} = \frac{1}{1} = 1$$

If  $n > 4$ , then

$$i^{-n} = \frac{1}{i^n} = \frac{1}{i^r}, \text{ where } r \text{ is the remainder when } n \text{ is divided by } 4.$$

**NOTE**  $i^0$  is defined as 1.

### Properties of Iota

I. Periodic properties of  $i$

$$i^{4n} = 1, i^{4n+1} = i, i^{4n+2} = -1, i^{4n+3} = -i \forall n \in \mathbb{Z}$$

II. Sum of four consecutive power terms of  $i$  is zero.

$$\text{i.e., } i^n + i^{n+1} + i^{n+2} + i^{n+3} = 0 \forall n \in \mathbb{Z}$$

**Example** Evaluate :  
 $i^{35}$

**Sol.** 135 leaves remainder as 3 when it is divided by 4.  
 $\therefore i^{35} = i^3 = -i$

### 03. Imaginary Quantities

The square root of a negative real number is called an imaginary quantity or an imaginary number.

For example,  $\sqrt{-3}$ ,  $\sqrt{-4}$ ,  $\sqrt{-9/4}$  etc. are imaginary quantities.

#### RESULT

If  $a, b$  are positive real numbers, then  $\sqrt{-a} \times \sqrt{-b} = -\sqrt{ab}$ .

**NOTE** (1) For any two real numbers  $\sqrt{a} \times \sqrt{b} = \sqrt{ab}$  is true only when at least one of  $a$  and  $b$  is either positive or zero. In other words,  $\sqrt{a} \times \sqrt{b} = \sqrt{ab}$  is not valid if  $a$  and  $b$  both are negative.  
 (2) For any positive real number  $a$ , we have  $\sqrt{-a} = \sqrt{-1 \times a} = \sqrt{-1} \times \sqrt{a} = i\sqrt{a}$ .

### 04. Complex Numbers

#### COMPLEX NUMBER

If  $a, b$  are two real numbers, then a number of the form  $a + ib$  is called a complex number.  
For example,  $7 + 2i$ ,  $-1 + i$ ,  $3 - 2i$ ,  $0 + 2i$ ,  $1 + 0i$  etc. are complex numbers.

Real and imaginary parts of a complex number: If  $z = a + ib$  is a complex number, then ' $a$ ' is called the real part of  $z$  and ' $b$ ' is known as the imaginary part of  $z$ . The real part of  $z$  is denoted by  $\text{Re}(z)$  and the imaginary part by  $\text{Im}(z)$ .

Example  $z = 3 - 4i$ , then  $\text{Re}(z) = 3$  and  $\text{Im}(z) = -4$ .

Purely real and purely imaginary complex numbers: A complex number  $z$  is purely real if its imaginary part is zero i.e.  $\text{Im}(z) = 0$  and purely imaginary if its real part is zero i.e.  $\text{Re}(z) = 0$ .

Set of complex numbers: The set of all complex numbers is denoted by  $C$  i.e.  
 $C = \{a + ib : a, b \in R\}$ .

**NOTE** Since a real number ' $a$ ' can be written as  $a + 0i$ . Therefore, every real number is a complex number. Hence,  $R \subset C$ , where  $R$  is the set of all real numbers.

## 05. Equality of Complex Numbers

**Definition** Two complex numbers  $z_1 = a_1 + ib_1$  and  $z_2 = a_2 + ib_2$  are equal if  $a_1 = a_2$  and  $b_1 = b_2$  i.e.  $Re(z_1) = Re(z_2)$  and  $Im(z_1) = Im(z_2)$ .

Thus,  $z_1 = z_2 \Leftrightarrow Re(z_1) = Re(z_2)$  and  $Im(z_1) = Im(z_2)$ .

## 06. Algebra of Complex Numbers

### ADDITION

**Definition** Let  $z_1 = a_1 + ib_1$  and  $z_2 = a_2 + ib_2$  be two complex numbers. Then their sum  $z_1 + z_2$  is defined as the complex number  $(a_1 + a_2) + i(b_1 + b_2)$ . The sum  $z_1 + z_2$  is a complex number such that  $Re(z_1 + z_2) = Re(z_1) + Re(z_2)$  and  $Im(z_1 + z_2) = Im(z_1) + Im(z_2)$

### PROPERTIES OF ADDITION OF COMPLEX NUMBERS

- (i) Addition is Commutative: For any two complex numbers  $z_1$  and  $z_2$ , we have  

$$z_1 + z_2 = z_2 + z_1.$$
- (ii) Addition is Associative: For any three complex numbers  $z_1, z_2, z_3$ , we have  

$$(z_1 + z_2) + z_3 = z_1 + (z_2 + z_3)$$
- (iii) Existence of Additive Identity: The complex number  $0 = 0 + i0$  is the identity element for addition i.e.  $z + 0 = z = 0 + z$  for all  $z \in C$ . The complex number  $0 = 0 + i0$  is the identity element for addition.
- (iv) Existence of Additive Inverse: For any complex number  $z = a + ib$ , there exists  $-z = (-a) + i(-b)$  such that  $z + (-z) = 0 = (-z) + z$ . The complex number  $-z$  is called the additive inverse of  $z$ .

## 07. Subtraction of Complex Numbers

**Definition** Let  $z_1 = a_1 + ib_1$  and  $z_2 = a_2 + ib_2$  be two complex numbers. Then the subtraction of  $z_2$  from  $z_1$  is denoted by  $z_1 - z_2$  and is defined as the addition of  $z_1$  and  $-z_2$ .

Thus,  $z_1 - z_2 = z_1 + (-z_2) = (a_1 + ib_1) + (-a_2 - ib_2) = (a_1 - a_2) + i(b_1 - b_2)$

## 08. Multiplication of Complex Numbers

Let  $z_1 = a_1 + ib_1$  and  $z_2 = a_2 + ib_2$  be two complex numbers. Then the subtraction of  $z_1$  with  $z_2$  is denoted by  $z_1 z_2$  and is defined as the complex number  $(a_1 a_2 - b_1 b_2) + i(a_1 b_2 + a_2 b_1)$ .

Thus,  $z_1 z_2 = (a_1 + ib_1)(a_2 + ib_2)$

$\Rightarrow z_1 z_2 = (a_1 a_2 - b_1 b_2) + i(a_1 b_2 + a_2 b_1)$

$\Rightarrow z_1 z_2 = [Re(z_1) Re(z_2) - Im(z_1) Im(z_2)] + i [Re(z_1) Im(z_2) + Re(z_2) Im(z_1)]$
